

# Python3      Constraint Programming Tutorial/Manual

Nov.30.2020 Sugawara Systems

# Introduction

We describe how to write constraints using Python 3.

# When should we use Python3?

We can write most constraints using GUI. So, we recommend using GUI unless the following cases.

- There are constraints we can not describe using GUI.
- We want to switch the constraints on/off dynamically.
- Dynamic constraints will make the descriptions more maintainable.

# A workflow without Python3

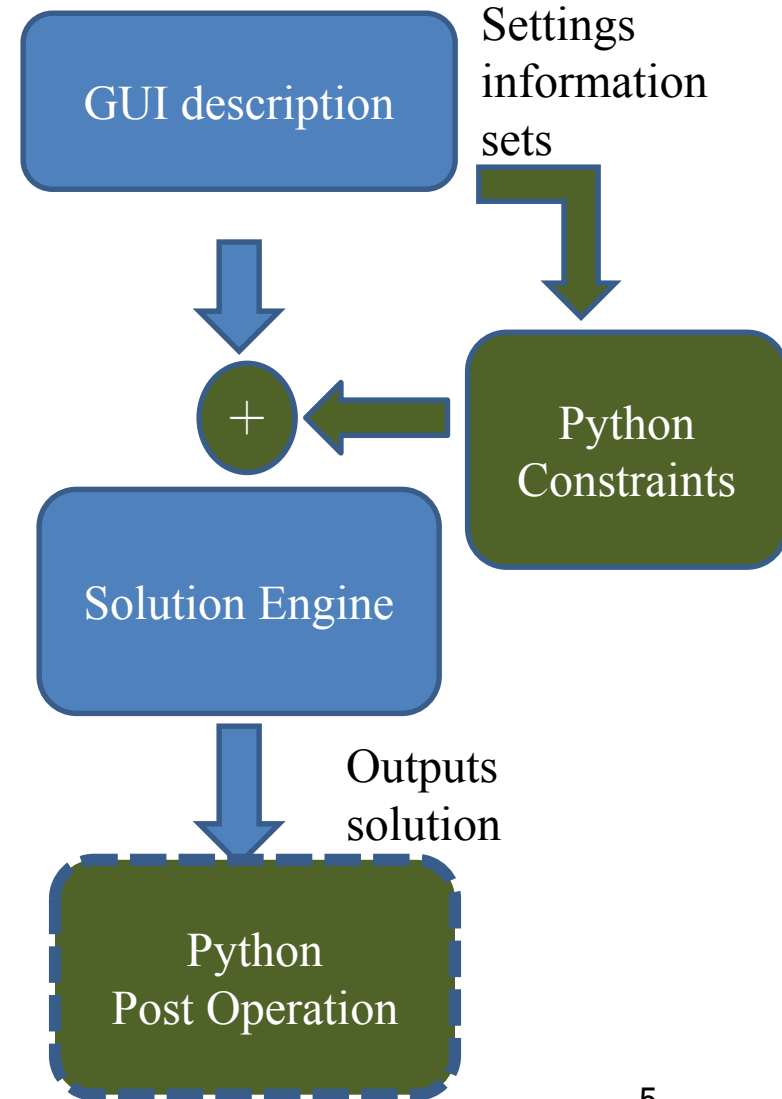

- A typical workflow without Python 3 looks like the one on the right.
- The solution engine receives a GUI description and outputs the solution.

# A workflow using Python3

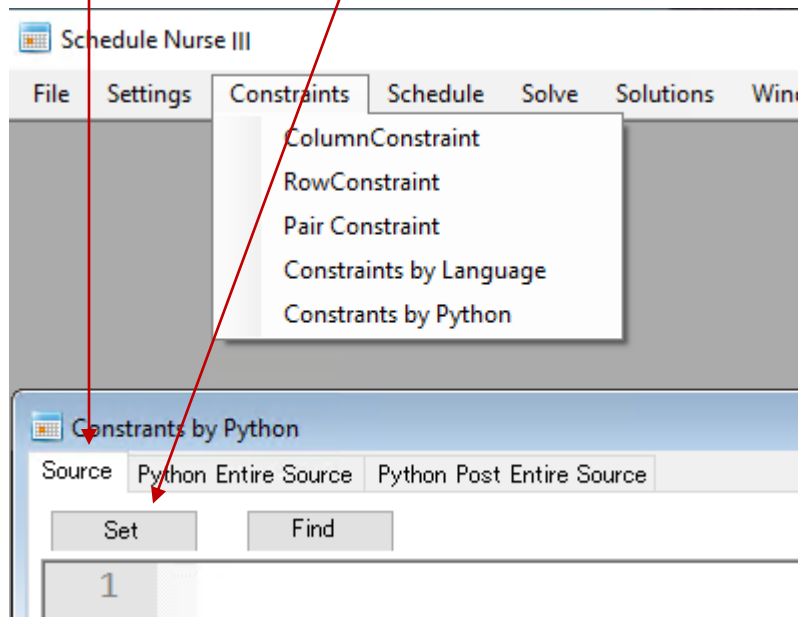

- We describe constraints on Python3, utilizing the set of information of GUI. We can write rules on minimum efforts since GUI already has the necessary settings.
- You can add constraints with add-ons. On the other hand, you can also easily detach them by a checkbox.
- If needed, we can add a post solution operation using shift and task solution.

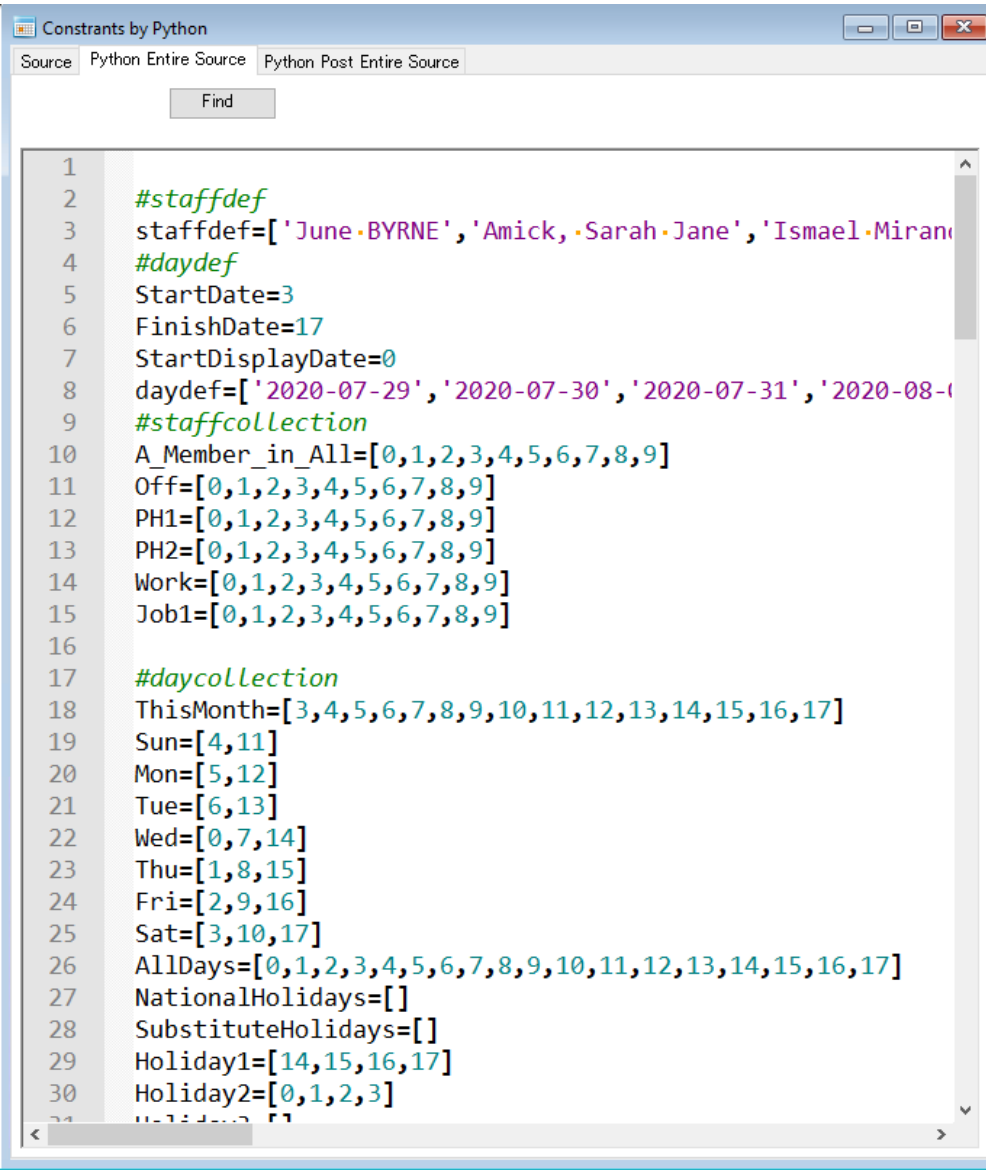

# Python Source Edit

- **Constraints** → **Constraints by Python** → **Source**
- **Source** is the only page where users can write Python code.
- When you click **Set**, your project will import the source.

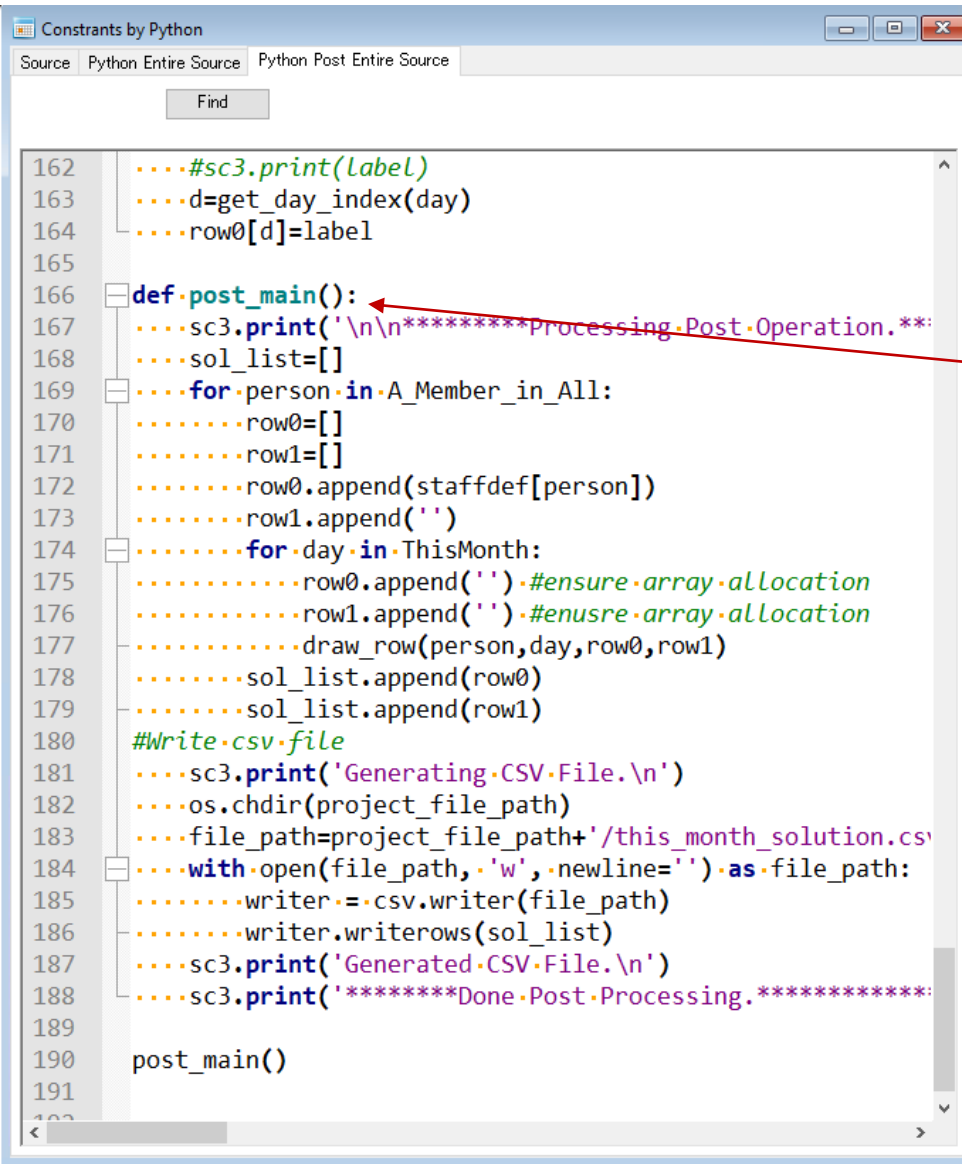

# Python Entire Source

30 Holiday2=[0,1,2,3]
```

- This page is also Read Only.
- The description is GUI-generated information , followed your written source.
- Python interpreter in the solver interprets and executes the code on this page.
- The purpose of the page is to show the error position and for your reference to GUI objects.

# Python Post Entire Source

```
162 .....#sc3.print(label)
163 .....d=get_day_index(day)
164 .....row0[d]=label
165
166 def post_main():
167 .....sc3.print('\n\n*****Processing Post Operation.**')
168 .....sol_list=[]
169 .....for person in A_Member_in_All:
170 .....    row0=[]
171 .....    row1=[]
172 .....    row0.append(staffdef[person])
173 .....    row1.append('')
174 .....    for day in ThisMonth:
175 .....        row0.append('') #ensure array allocation
176 .....        row1.append('') #ensure array allocation
177 .....        draw_row(person, day, row0, row1)

184 .....    with open(file_path, 'w', newline='') as file_path:
185 .....        writer = csv.writer(file_path)
186 .....        writer.writerows(sol_list)
187 .....    sc3.print('Generated CSV File.\n')
188 .....    sc3.print('*****Done Post Processing.*****')
189
190 post_main()
```

- This page is also Read Only.
- The description is GUI-generated information and the solution information, followed your written source.
- `def post_main()` is a dedicated function for post-processing. If you write it in the source, python will automatically invoke `post_main()` as its main routine after you solve the problem.

# How to run Python

- First, declare `import sc3`.
- Click on `Set`.
- Check the `Use Language Constraints` checkbox.
- Click on `Solve`.

# Python Version

Supports Python 3.68 and above.

# GUI Notes on Python

- In the GUI description, we use almost all of the entries as python variables. In some cases, we should modify the variable name to address the parser error in Python. The solver renames them automatically to keep as much of the original character as possible.
- However, please keep this in mind for an easier reading of python code.  
Followings are examples of the error (letters).  
  
‘\*-()[].’  
‘1variable’ is illegal, variable1 is legal.
- Of course, you can ignore the rule above if you have no plan to use Python.

# Hello World!

- Load , and **Solve** the project hello\_python\_world.nurse3.
- You should see a **Hello...** in the right pane.

The screenshot shows the 'Solve' application interface. At the top, there is a 'Solve' button. Below it is the 'Soft Solving Settings' section with a table:

Item	Enable	Weight	Allowabl

Below the settings is the 'Constraints by Python' window. It has tabs for 'Source' (Python Entire Source, Python Post Entire Source) and buttons for 'Set' and 'Find'. The code editor shows:

```
1 import sc3
2 sc3.print('Hello.Python3.Constraint.World!\n')
```

At the bottom left, there is a table with solving parameters:

Number Of Solutions	1
Prevent Repeated Schedule Errors	<input checked="" type="checkbox"/>
Number Of CPUs	1
Enable Implicit Hard Weights for Colum	<input checked="" type="checkbox"/>
Hard Timeout(sec)	30
Error Analysis	<input checked="" type="checkbox"/>
Soft Timeout(sec)	10
Use Language Constraint	<input checked="" type="checkbox"/>

On the right, the 'Note' pane displays the following output:

```
Preparing to compile.
Calling solver

Generating python property file finished.
Finished writing satisfactory solution.
14700 [KB] used.
0.084000(sec)
Compiling constraints..
Hello Python3 Constraint World!
Algorithm 1 Solving Process Started..
```

Below the output is a table:

Weight	Errors	Cost
Total		0

At the bottom right, the status bar shows:

```
o 0(0)
Finished solving process. 1 (sec)
Getting Successful Result.
```

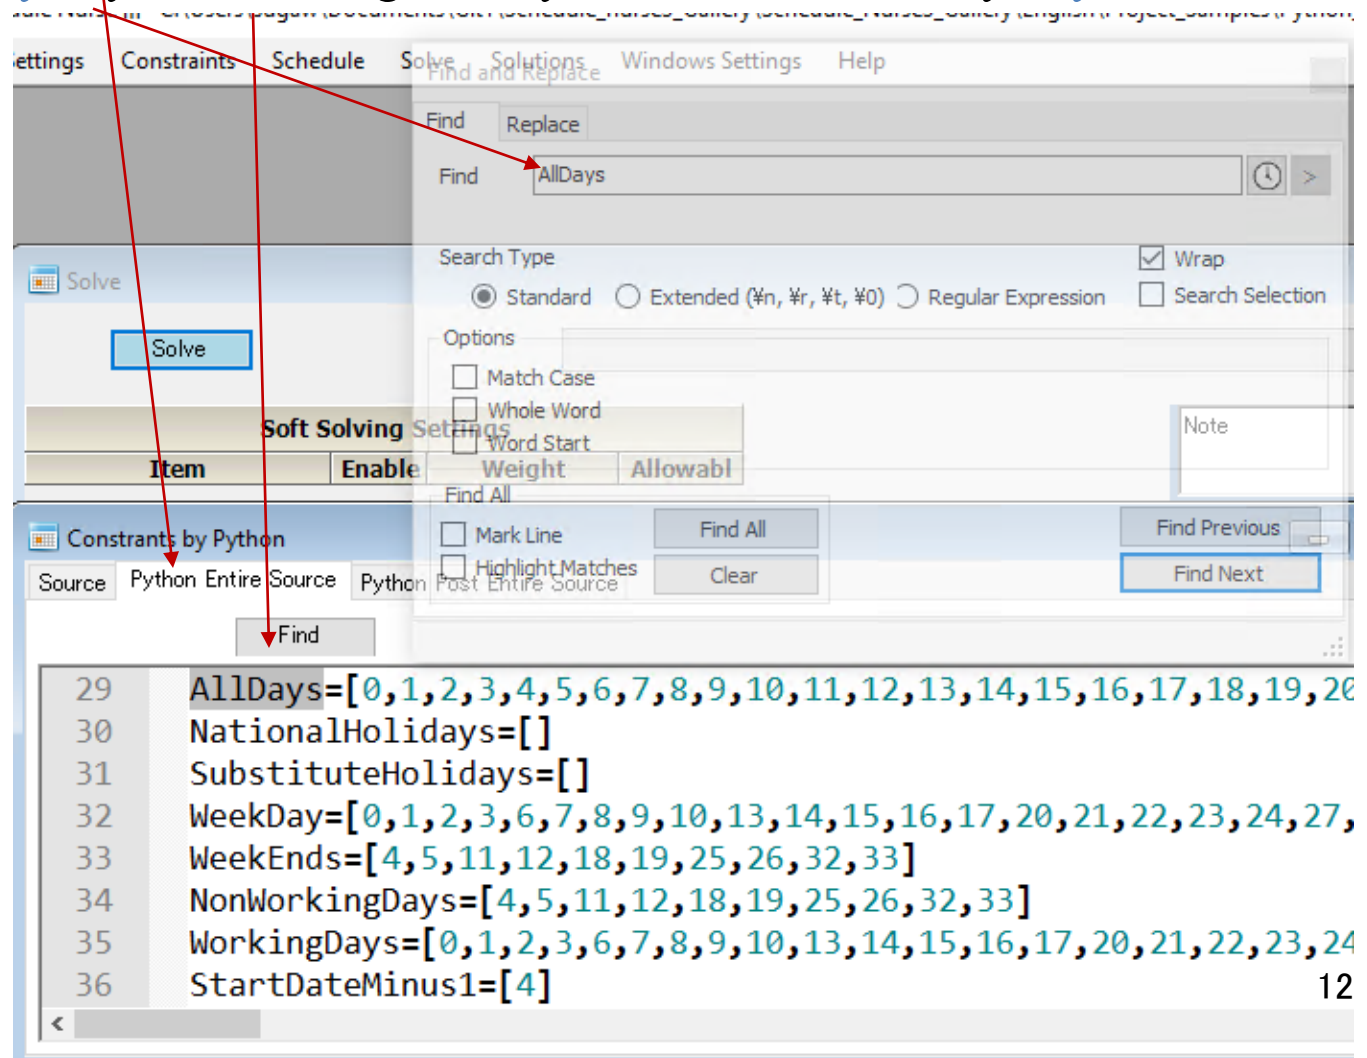

# python\_tutorial1

- Load the project Python\_tutorial1.nurse3
- Use `sc3.print()` for displaying value of variables. It can only display string, so you need to convert integer to a string using `str()`.

```
1 import sc3
2
3 for day in AllDays:
4     sc3.print('\\t\\tDay.index'+str(day)+' is '+daydef[day]+'\\.\\n')
5
```

# Where is AllDays and daydef?

- Click on **Python Entire Source**, which is output from Solution Solver.
- You can find **AllDays** by Find Dialog. Also you can find 1D array **daydef**.

# Log of python\_tutorial1

■ See the generated log. You can see the python interpreter displays the `sc3.print` data, and then the nominal solving process will start.

Generating python property file finished.  
Compiling constraints..

Day index0 is 2020-10-27.  
Day index1 is 2020-10-28.  
Day index2 is 2020-10-29.

...

Algorithm 1 Solving Process Started..

■ Each shift is OneHot encoded, which results that

A\_Member\_in\_All\*AllDays\*Shifts per day binary variables exist in the search space. You can call any shift variable per the following format.

```
v=sc3.GetShiftVar(person,day,shift);
```

where person/day are zero-based index and shift is zero-based index or string.

■ The most important thing to remember is the activated shift is at least one and at most one per day per staff. For example, if you assert any Shift variable, the other variables on the same person and the day automatically become de-asserted.

- The following format is a function to add a hard constraint.

## **sc3.AddHard(v,string)**

- *v* is the shift variable obtained by GetShiftVar or the output variable of And/Or/Not/SeqExpr/SeqComp.

```
1 import sc3
2
3 for person in A_Member_in_All:
4     for day in Mon:
5         v = sc3.GetShiftVar(person, day, 'Paid_Holiday')
6         s = 'Paid_Holiday_Constraint' + ' ' + staffdef[person] + ' ' + daydef[day]
7         sc3.print(s)
8         sc3.AddHard(v, s)
```

# Python\_tutorial2 result

■ You can see all staff could be given a Paid\_Holiday on Mondays.

## python\_tutorial2\_error

- We made every Monday a Paid\_Holiday Shift using Python. In contrast, We put the Day\_Shift on Monday on the Schedule. Since Python constraints and the Schedule are contradictory and both are hard-constraints, we have no answer.
- Look at the right pane; you'll see Red Marked portions.

```

## And Or Not : python\_tutorial5

- Consider the problem we have four Paid\_Holidays out of five Mondays using only logical operators.
- Since the problem requires  $\sum \sim \text{Paid\_Holiday} = 1$ . We have the following two constraints.
  - 1)  $\sum \sim \text{Paid\_Holiday} \geq 1$ ;
  - 2) 2) Of all the combinations that take two from five,  $\sim \text{Paid\_Holiday}$  and  $\sim \text{Paid\_Holiday}$  are prohibited. i.e.  $\sum \sim \text{Paid\_Holiday} \leq 1$ ;
- Enumerating all the combinations of 5 to 2 that we can take is a pain, but we can leave that to Python Itertools, which will enumerate all the combinations for us.

# python\_tutorial5 result

- We were able to achieve the specification that only one of the five Mondays is not a Paid\_Holiday.

# python\_tutorial6 Cardinal Constraints

■ The constraints on inequalities are called cardinal constraints. In python\_tutorial6,  $X_i = \text{Paid\_Holiday}$

$$\sum \sim X_i \leq 4 \text{ AND } \sum \sim X_i \geq 4$$

using only the logical expressions And, Or, Not.

■ However, the cardinal constraint has its own dedicated function.

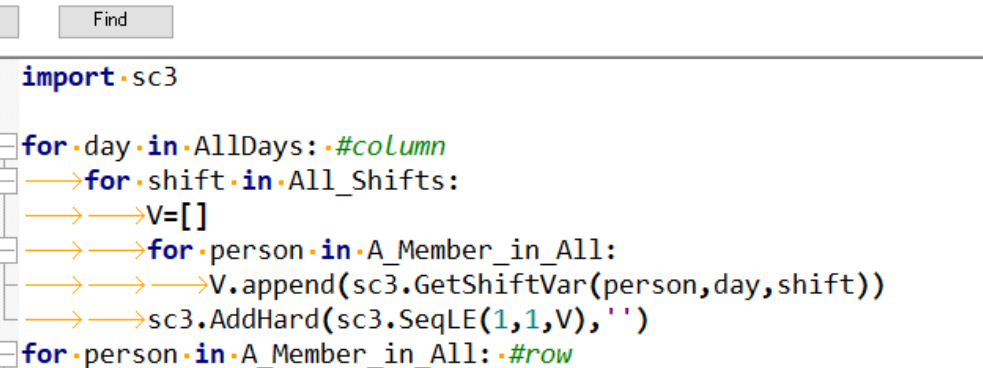

**sc3.SeqLE(min,max,List)**

The List must be List of the shift/task variable, or the output of And/Or/Not, etc.

```

10        vlist.append(v)
11        sc3.AddHard(sc3.SeqLE(4,4,vlist),s)
12
```

- 
- The screenshot shows a window titled "Constraints by Python". It has three tabs: "Source", "Python Entire Source", and "Python Post Entire Source". Below the tabs are two buttons: "Set" and "Find". The main area displays a Python script with line numbers 1 through 23. The script defines a list V and iterates over days, shifts, and people to generate constraints. The code is as follows:
- ```

1  import sc3
2
3  for day in AllDays: #column
4      for shift in All_Shifts:
5          V=[]
6          for person in A_Member_in_All:
7              V.append(sc3.GetShiftVar(person,day,shift))
8              sc3.AddHard(sc3.SeqLE(1,1,V), '')
9  for person in A_Member_in_All: #row
10     for shift in All_Shifts:
11         V=[]
12         for day in AllDays:
13             V.append(sc3.GetShiftVar(person,day,shift))
14             sc3.AddHard(sc3.SeqLE(1,1,V), '')
15  for person in Block_Top: #block
16     for shift in All_Shifts:
17         for day in Block_Top:
18             V=[]
19             for i in range(3):
20                 for j in range(3):
21                     V.append(sc3.GetShiftVar(person+i,day+j,shift))
22                     sc3.AddHard(sc3.SeqLE(1,1,V), '')
23

```

# AddSoft python\_tutorial7

■ The following is the format of adding a soft constraint.

**sc3.AddSoft(variable ,string ,soft\_level)**

,where soft\_level must be a constant(1-7).

■ Since the first time you add a soft level, a checkbox in solving parameters is empty; you need to select the checkbox so that the constraint becomes effective.

The screenshot shows the 'Solve' window with two main panels. The left panel, 'Soft Solving Settings', contains a table with columns 'Item', 'Enable', 'Weight', and 'Allowabl'. The 'Language Constraint:4' row has an unchecked 'Enable' checkbox, a weight of 1, and an allowability of 3. The right panel, 'Constraints by Python', shows a list of Python constraints. The first constraint is a loop over 'person' in 'A\_Member\_in\_All' that adds a soft constraint for 'Paid\_Holiday' with a soft level of 4. The second constraint is a loop over 'v' in 'itertools.combinations(vlist,2)' that adds a soft constraint for 'v' with a soft level of 4. Red arrows point from the text in the first block to the 'Enable' checkbox and the 'soft\_level' parameter in the code.

| Item                  | Enable                   | Weight | Allowabl |
|-----------------------|--------------------------|--------|----------|
| Language Constraint:4 | <input type="checkbox"/> | 1      | 3        |

```
1 import sc3
2 import itertools
3
4 for person in A_Member_in_All:
5     vlist=[]
6     s='Python.Paid.Holiday'+'+'+staffdef[person]+'\\n'
7
8     for day in Mon:
9         v=sc3.GetShiftVar(person,day,'Paid_Holiday')
10        vlist.append(v)
11        sc3.AddSoft(vlist[0]+vlist[1]+vlist[2]+vlist[3]+vlist[4],s,4)#soft_level.4
12
13 for v in itertools.combinations(vlist,2):
14     sc3.AddSoft(v[0]+v[1],s,4)#soft_level.4import sc3
15
```

# SeqError python\_tutorial8

■ The following is the format when we use cardinality constraint as a soft constraint.

**sc3.SeqError(min,max,allowable\_errors,list)**

■ Please note we use sc3.SeqLE for hard constraints instead of the above.

■ Let's look at the result of the project. We should have set it to 4 Paid Holiday, but the reason it's not is that the we entered DayShifts as hard scheduled entries. A Hard constraint is always the winner for any soft rules.

■ The allowable\_errors is the parameter of how many of these errors are allowed. Be careful to be set the number because over the limit should cause a hard error.

Constraints by Python

```
Source Python Entire Source Python Post Entire Source
Set Find
7 .....v=sc3.GetShiftVar(person,day,'Paid_Holiday')
8 .....vlist.append(v)
9 .....sc3.AddSoft(sc3.SeqError(4,4,4,vlist),s,4).#min*max*allowable_errors*listimp
```

# SeqError python\_tutorial9

■ When we make the weights of the schedule constraints larger than the cardinality constraints, there are no errors in the cardinality constraints. Instead, we should have a changed schedule due to weaker weight. In this way, we can change the priority without modifying the Python source code.

The screenshot displays a scheduling application with a staff list on the left and a calendar grid on the right. The staff list includes 'Ismael Miranda' and 'Scott Lambert'. The calendar grid shows days of the week and dates. A red arrow points from the text 'we should have a changed schedule due to weaker weight' to the 'Solve' button. Another red arrow points from the text 'we can change the priority without modifying the Python source code' to the 'Soft Solving Settings' table.

**StaffList**

| StaffName      | Filter | Previous Month | The1Week | The2Week |
|----------------|--------|----------------|----------|----------|
| Ismael Miranda |        | 28 Wed         | 29 Thu   | 30 Fri   |
| Scott Lambert  |        | 31 Sat         | 1 Sun    | 2 Mon    |

**Soft Solving Settings**

| Item                  | Enable | Weight | Allowable |
|-----------------------|--------|--------|-----------|
| Language Constraint:4 | ✓      | 2      | 3         |
| Scheduled:2           | ✓      | 1      | 3         |

**Note**

| Weight | Errors | Cost |
|--------|--------|------|
| 2      | 0      | 0    |
| 1      | 10     | 10   |

# SeqComp python\_tutorial10

■ `sc3.SeqComp(X,Y)` is a function that returns True if  $\sum X(i) == \sum Y(i)$ .  
When combined with `AddHard`, you can constraint  $\sum X(i)$  equals to  $\sum Y(i)$ .

The number of Saturday Visit-Shift equals to the number of Half-Shift for the month.

The screenshot displays a software interface with three main components:

- Data Table:** A table with columns A, B, C, and D. Rows 1-5 show values for 'Half\_C', 'Visit\_', 'Visit\_Sun\_CNT', and 'Sub\_C'. Red boxes highlight the 'Visit\_Sun\_CNT' and 'Sub\_C' columns.
- Calendar:** A calendar view showing days of the week and months. A red arrow points from the 'Visit\_Sun\_CNT' column to the 'Sat' column in the calendar.
- Python Constraints Editor:** A window titled 'Constraints by Python' showing a Python script. A red arrow points from the 'Sub\_C' column to the 'Sun' column in the calendar.

The Python script in the constraints editor is as follows:

```
11 for day in ThisMonth:
12     v=sc3.GetShiftVar(person,day,'Visit_Shift')
13     vD=sc3.GetShiftVar(person,day,'Sub_Shift')
14     vH=sc3.GetShiftVar(person,day,'Half_Shift')
15
16     if day in Sat:
17         Sat_WORKCNT.append(v)
18         sc3.AddHard(~vD,'No_Sub_Shift_on_Sat.'+str(person))
19         sc3.AddHard(~vH,'No_Half_Shift_on_Sat.'+str(person))
20     elif day in Sun:
21         Sun_WORKCNT.append(v)
22         sc3.AddHard(~vD,'No_Sub_Shift_on_Sun.'+str(person))
23         sc3.AddHard(~vH,'No_Half_Shift_on_Sun.'+str(person))
24     else:
25         Sub_CNT.append(vD)
26         Half_CNT.append(vH)
27         vlist.append(v)
28     sc3.AddHard(sc3.SeqComp(Half_CNT,Sat_WORKCNT),'seqComp'+str(person))
29     sc3.AddHard(sc3.SeqComp(Sub_CNT,Sun_WORKCNT),'seqComp'+str(person))
30
```

The number of Sunday Visit-Shift is equal to the number of Sub-Shift for the month.

# python\_tutorial13 cardinality constraint per staff

- You can retrieve any staff property that consists of only numbers as a Python Dictionary.
- For example ,we set the number of DayShifts per each staff based on the dictionary on Python as figure below.

The screenshot displays a software interface with two main windows. The background window is titled 'Staff Definitions' and has tabs for 'Staff Definitions', 'Shifts per Staff', 'Group Definitions', 'Group Aggregate Definitions', and 'Tasks per Person'. The 'Staff Definitions' tab is active, showing a table with 18 staff members. The table has columns: No., Enable, StaffName, comment, All\_Members, NbOfDayShiftsMax, and NbOfDayShiftsMin. The 'NbOfDayShiftsMax' and 'NbOfDayShiftsMin' columns have dropdown menus. The foreground window is titled 'Constraints by Python' and has tabs for 'Source', 'Python Entire Source', and 'Python Post Entire Source'. The 'Python Entire Source' tab is active, showing a Python script that sets cardinality constraints for each staff member based on their 'NbOfDayShiftsMax' and 'NbOfDayShiftsMin' values.

| No. | Enable                              | StaffName             | comment | All_Members     | NbOfDayShiftsMax | NbOfDayShiftsMin |

17        .....sc3.AddHard(sc3.SeqLE(min,max,vlist),s)
```

# python\_tutorial11\_error

■ This is an example of reading scheduled shifts and showing an error before the solver issues the hard error.

The image shows a Python IDE window titled "Constraints by Python" with a file named "Python Post Entire Source". The code defines a function `check_consecutive3days()` that iterates over all members and days, checking for consecutive visits. A red arrow points from the `if` condition in the code to the solver output.

```
1 import sc3
2
3 def check_consecutive3days():
4     for person in A_Member_in_All:
5         for day in AllDays:
6             if day < StartDate:
7                 continue
8
9             ts = shift_schedules[person][day][0] #Read.schedu
10            tsy = shift_schedules[person][day-1][0] #Read.sch
11            tsyy = shift_schedules[person][day-2][0] #Read.sc
12
13            s = 'Prohibit Consecutive 3Visits' + ' ' + staffdef[
14                person]
15            if ts == 'Visit_Shift' and tsy == 'Visit_Shift':
16                sc3.print('*****Consecutive 3Visits Error
17                x0 = sc3.GetShiftVar(person, day, 'Visit_Shift')
18                x1 = sc3.GetShiftVar(person, day-1, 'Visit_Shift')
19                x2 = sc3.GetShiftVar(person, day-2, 'Visit_Shift')
20                sc3.AddHard(~x0 | ~x1 | ~x2, s) #Hard Constraint
21
22
23 check_consecutive3days()
```

The solver output window shows the following messages:

```

24             V = []
25             s = 'PythonBlockConstraint_' + staffdef[person] + ' ' + daydef[day] + ' ' + task + '\n'
26             for i in range(3):
27                 for j in range(3):
28                     V.append(sc3.GetTaskVar(person + i, day, j, task))
29             sc3.AddHard(sc3.SeqLE(1, 1, V), s)
30
```

# Post Processing

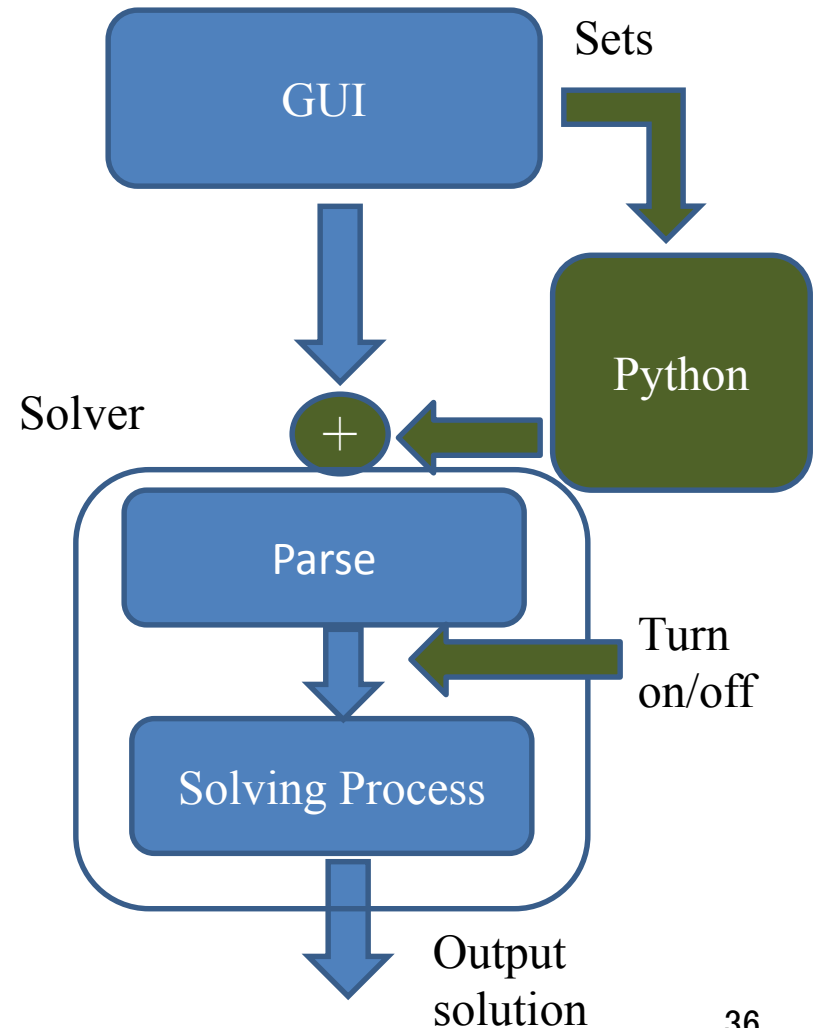

- After solution generation, for example, you should write the following when you want to output a formatted solution.
  - The example is Task\_Projects/task\_import1.nurse3.
- Define `def post_main():` in the source with the following order.

```
21 .....label=get_label(person,day)
22 .....#sc3.print(label)
23 .....d=get_day_index(day)
24 .....row0[d]=label
25
26 def post_main():
27 .....sc3.print('\n\n*****Processing.Post.Operation.**
28 .....sol_list=[]
29 .....for person in A_Member_in_All:
30 .....    row0=[]
31 .....    row1=[]
32 .....    row0.append(staffdef[person])
33 .....    row1.append('')
34 .....    for day in ThisMonth:
35 .....        row0.append('')#.ensure.array.allocation
36 .....        row1.append('')#.enusre.array.allocation
37 .....        draw_row(person,day,row0,row1)
38 .....        sol_list.append(row0)
39 .....        sol_list.append(row1)
40 .....#Write.csv.file
41 .....sc3.print('Generating.CSV.File.\n')
42 .....os.chdir(project_file_path)
43 .....file_path=project_file_path+'/this_month_solution.csv
44 .....with open(file_path,'w',.newline='') as file_path:
45 .....    writer=.csv.writer(file_path)
46 .....    writer.writerows(sol_list)
47 .....sc3.print('Generated.CSV.File.\n')
48 .....sc3.print('*****Done.Post.Processing.*****')
49
50 .....#some_routine().#Write.main.routine.here.
```

# Constraints dynamic on/off

- We can turn on/off a constraint or a constraint group dynamically.
- The timing for turning on/off is right after the parsing in the solver

# Constraint group on/off python\_tutorial12

- `sc3.ConstraintEnable(name)` # name is groupname or groupname . Item\_name
- `sc3.ConstraintEnable(name, enable)`

The screenshot displays a software interface with a Python code editor on the left and three panels on the right for managing constraints.

**Python Code Editor:**

```
1 import sc3
2
3 def get_year(day_str):
4     #sc3.print(day_str)
5     return int(day_str[0:4])
6
7 def check_new_year():
8     start_year=get_year(daydef[StartDate])
9     finish_year=get_year(daydef[FinishDate])
10    sc3.print(str(start_year),str(finish_year))
11    if start_year!=finish_year:
12        return True
13    else:
14        return False
15
16 def address_new_year():
17    if check_new_year():
18        sc3.ConstraintEnable('NominalMonth',False)
19        sc3.ConstraintEnable('NewYearMonth')
20        sc3.ConstraintEnable('NewYearMonth_OffDays')
21        sc3.ConstraintEnable('NewYearColumn')
22        sc3.ConstraintEnable('NominalYearColumn',False)
23        sc3.ConstraintEnable('PairConstraintGroup2')
24        sc3.ConstraintEnable('PairConstraintGroup1',False)
```

Red arrows indicate the flow of data from the Python code to the constraint panels. Specifically, arrows point from the `sc3.ConstraintEnable` calls in the code to the corresponding constraint names and enable checkboxes in the panels.

■ **sc3.ConstraintEnable(name, enable, soft\_level)**

■ **sc3.SetSoftLeveltraintEnable(soft\_level, type, enable, weight, allowable\_errors)**

type: 'row', 'column', 'planned'

■ If you define a new level in ConstraintEnable, you should also call SetSoftLevel because the solver doesn't know what weight should use on the constraint.

```
.....sc3.ConstraintEnable('NewYearMonth.OffDays', True, 4) #If you define a new soft level
.....sc3.SetSoftLevel(4, 'row', True, 444, 3) # You have to call SetSoftLevel for the new level
.....# ..... level, row/column/planned, enable, weight, allowable errors
```

# Python Constraint Function Summary

|          | Format                                 | Description                                                                                                                                                                    | Can be used in | Return |
|----------|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|--------|
| SeqLE    | SeqLE(min,max,List)                    | Hard Cardinality                                                                                                                                                               | AddHard        |        |
| SeqError | SeqError(min,max,allowable erros,List) | Soft Cardinality                                                                                                                                                               | AddSoft        |        |
| SeqComp  | SeqComp(ListA,ListB)                   | $\Sigma \text{ListA} == \Sigma \text{ListB}$                                                                                                                                   |                | 1 bit  |
| SeqExpr  | SeqExpr(min,max,Type、 List)            | Type 0: $\Sigma \text{List} \leq \text{max}$<br>1: $\Sigma \text{List} \geq \text{min}$<br>2: $\Sigma \text{list} \leq \text{max} \ \&\& \ \Sigma \text{list} \geq \text{min}$ |                | 1 bit  |
